Application No.: 10/595,081 Amendment Dated: January 7, 2009

Reply to Office Action of: November 18, 2008

Amendments to the Specification:

Please replace the paragraph, beginning at page 6, line 10, with the following rewritten paragraph:

At this time, as the glass fibers, C glass of which alkali content is 17 wt% is used. When the viscosity temperature characteristics of the glass are analyzed by a beam bending method, the temperature of the distortion strain point is 525°C. C glass means glass of which alkali content is at least 0.8 wt% and at most 20 wt%, and especially glass for fiber having high acid resistance

Please replace Table 1, beginning at page 10, with the following rewritten Table:

T-11- 4

| Table 1 | | | | | | | | |
|---------|-------|------------------------------|------------------------|--------------------|---------------------|----------------------|---|-------------------------------|
| No. | Glass | | Characteristic of core | | | | Characteristic of vacuum heat insulator | |
| | Туре | Distortion Strain point (°C) | Binding material | Density (kg/m³) | Surface hardness | Handling property | Heat conductivit y (W/mK) | Density of core (kg/m³) |
| E1 | С | 525 | Non | 200 | 50 | good | 0.0020 | 235 |
| E2 | С | 525 | Non | 220 | 51 | good | 0.0019 | 240 |
| E3 | С | 525 | Non | 240 | 52 | good | 0.0018 | 260 |
| E4 | С | 525 | Non | 260 | 52 | good | 0.0020 | 270 |
| E5 | Α | 500 | Non | 220 | 52 | good | 0.0020 | 240 |
| E6 | С | 525 | Colloidal silica | 200 | 55 | excellent | 0.0024 | 230 |
| C1 | С | 525 | Eluting component | 220 | 51 | good | 0.0027 | 240 |
| C2 | С | 525 | Water glass | 220 | 55 | good | 0.0030 | 240 |
| _C3_ | С | 525 | Boric acid | 220 | 50 | good | 0.0029 | 240 |
| C4 | E | 560 | Non | 180 | 20 | bad | 0.0020 | 240 |

Please replace the paragraph, beginning at page 11, line 6, with the following rewritten paragraph:

On the other hand, the vacuum heat insulators in samples E1 to E5 using no binding material have heat conductivity of 0.018.0018 to 0.002 W/mK at average

Application No.: 10/595,081

temperature of 24°C, and have heat insulation performance that is 10 or more times higher than that of the general-purpose rigid polyurethane foam. Further, since the binder component is not used, gas generated from the binder component does not occur, and vacuum heat insulators having small degradation over time in heat insulation performance can be provided. Since the binder component is not required in molding the cores, man-hour can be reduced and the cores can be molded efficiently.

Please replace the paragraph, beginning at page 11, line 19, with the following rewritten paragraph:

In sample C4, E glass of high distortion strain point is used, but the core is molded at 480°C which is the same as that for C glass. Therefore, the heat deformation of the glass fibers is insufficient, core rigidity is insufficient, and the handling property of the core presents a problem. Though the core is molded to have the density of 220 kg/m³ thereof, the laminated body of the glass fibers cannot be molded in a predetermined thickness and hence the density after the molding is 180 kg/m³. Thus, it is preferable to use the glass containing alkali in core 2, because the molding temperature is low.
